MEASURE ASSIGNMENT TOOL

User Manual

SEPTEMBER 22, 2026

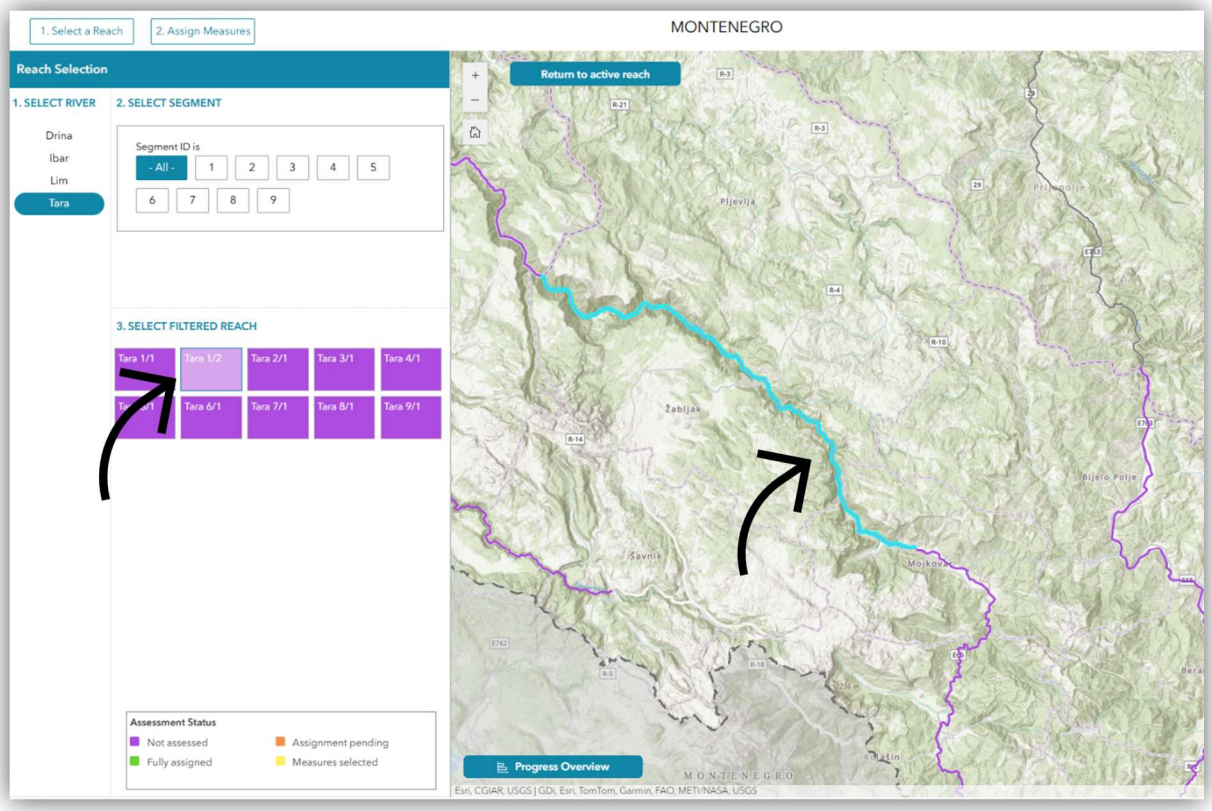

DANUBESEDIMENTQ2

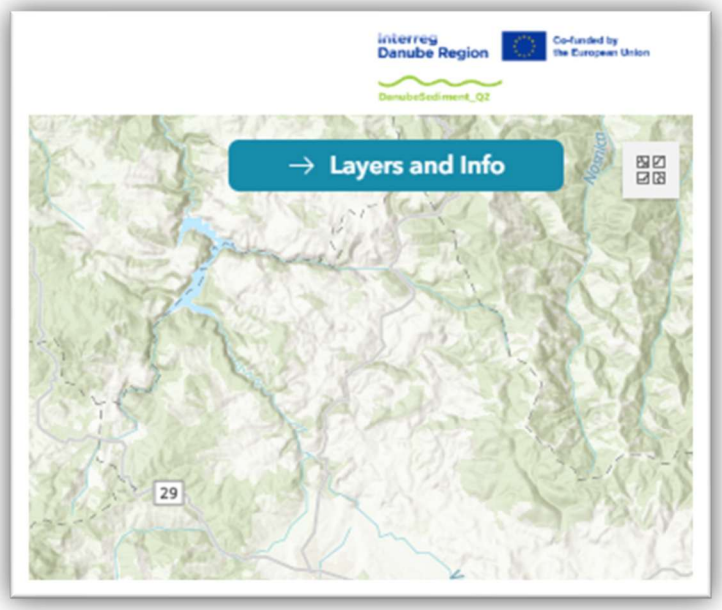

Select the river and the Segment ID. The list gets filtered automatically. Click on a displayed reach.

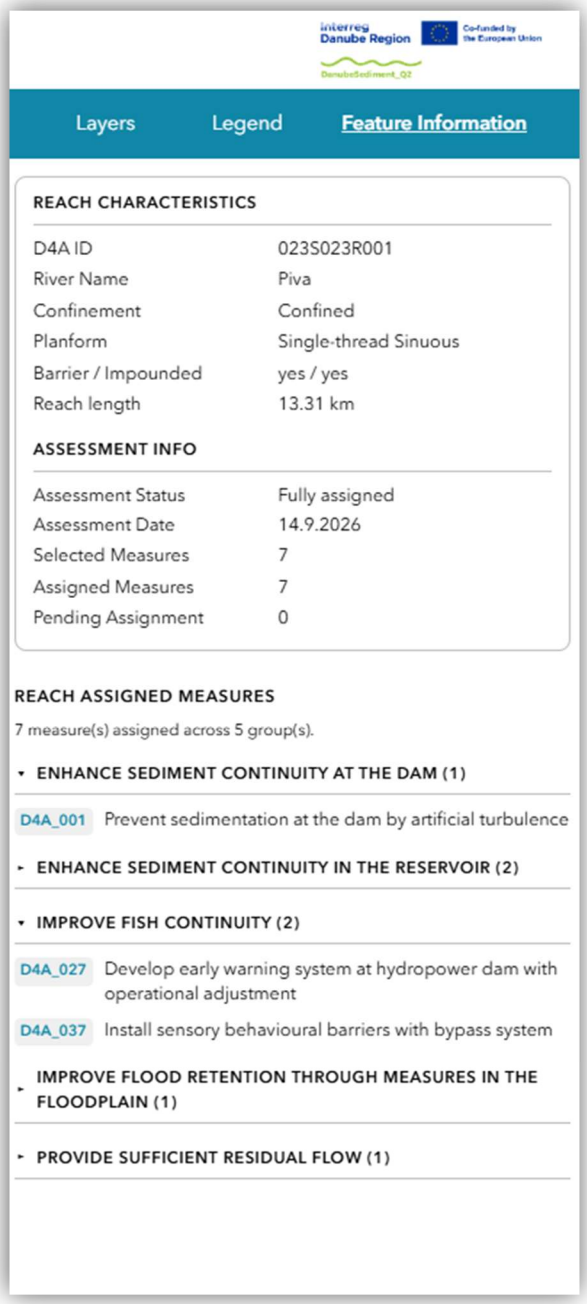

OR

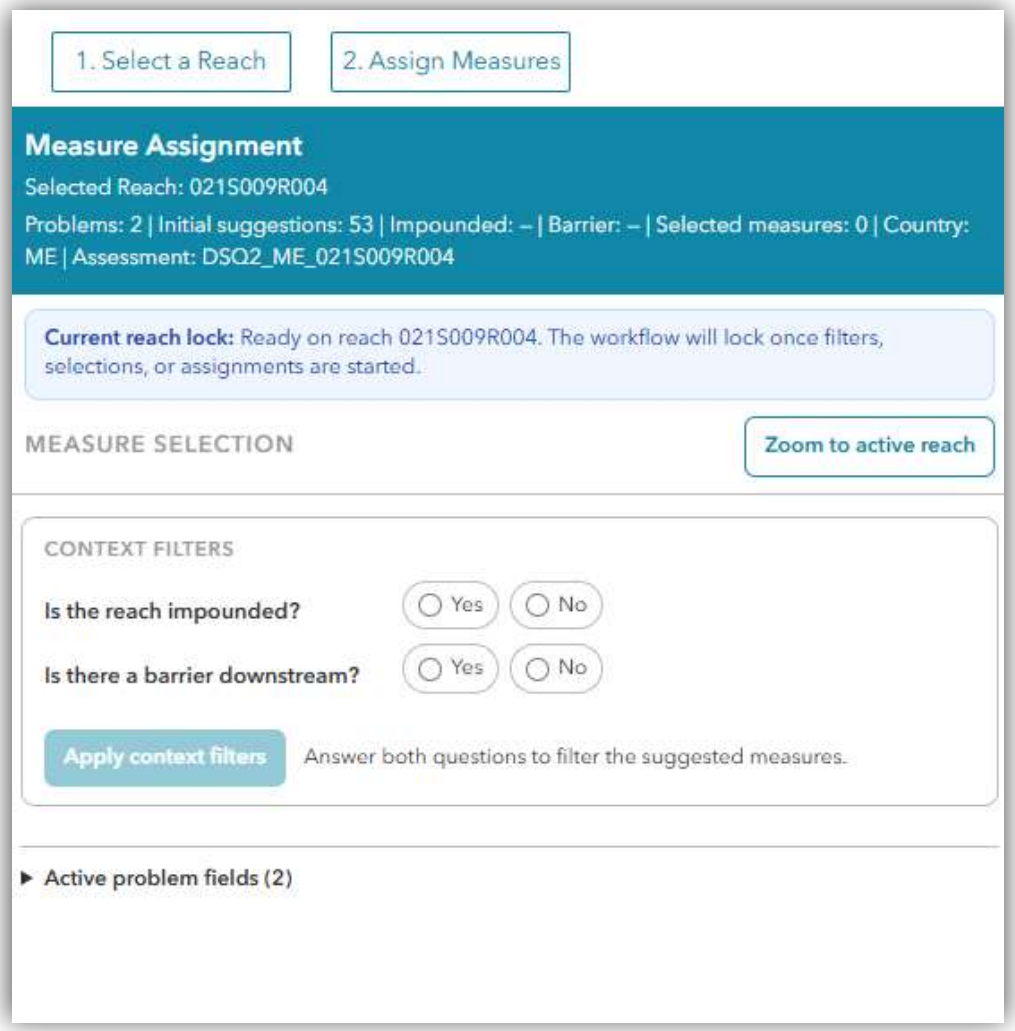

Click on a reach on the map. In the panel on the left, the selected reach will be highlighted. Click the highlighted reach in the selection panel and then proceed as usual.

When a feature, such as a reach or barrier, is selected on the map, click on **Layers and Legend** in the side panel. There, you can view all available information related to the selected feature.

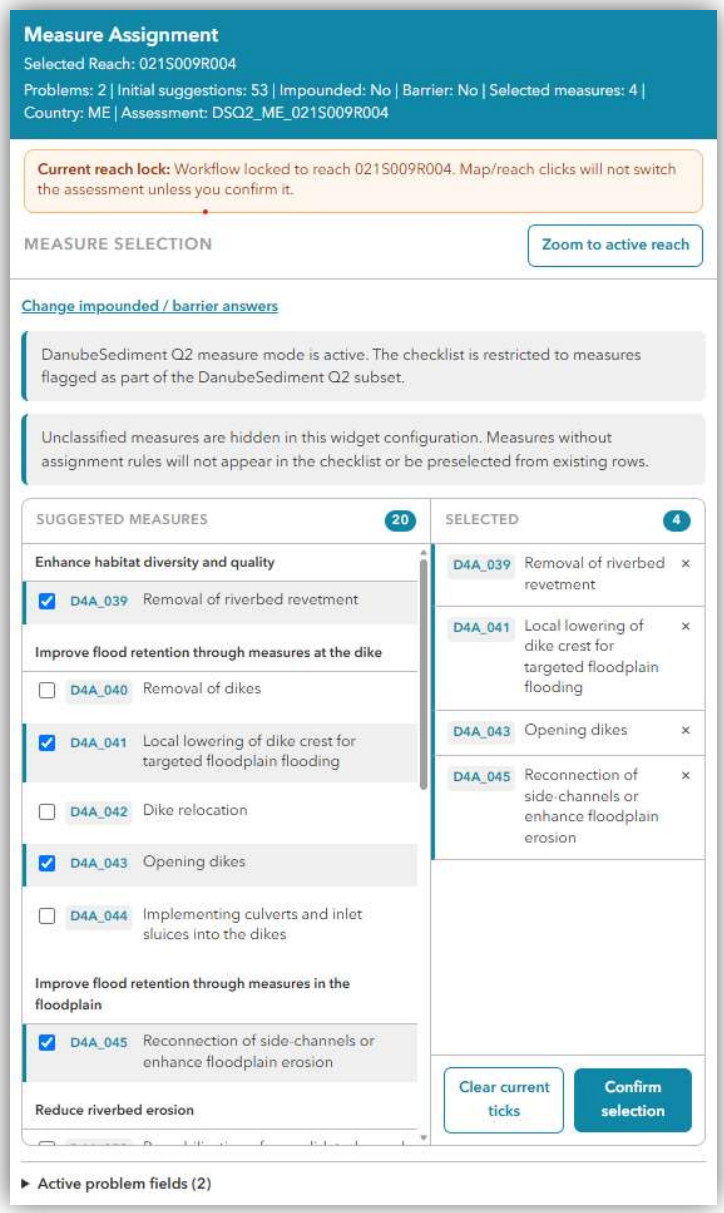

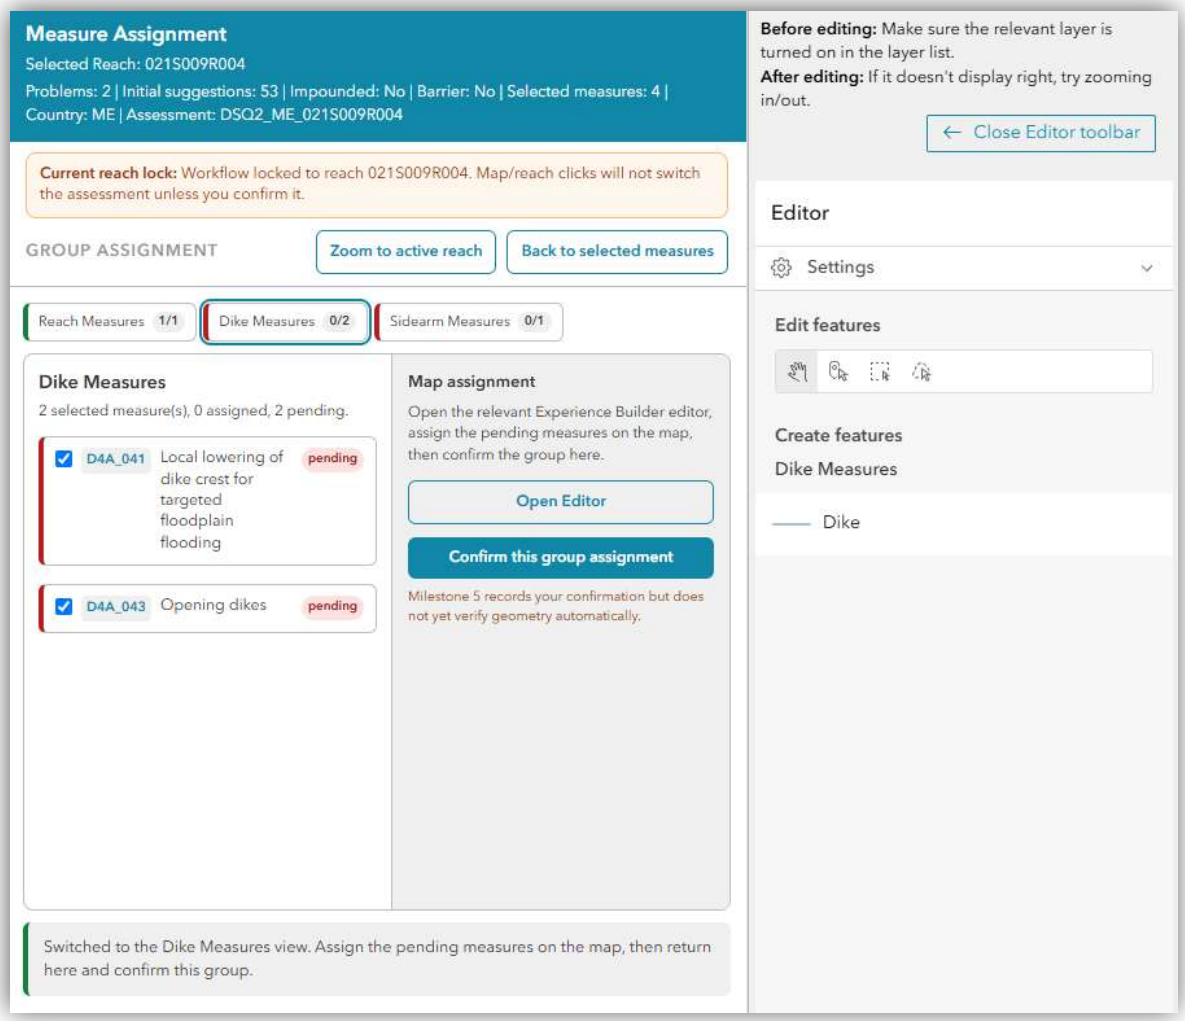

After selecting the reach, answer two yes/no questions:

- Is the reach impounded?
- Is there a barrier downstream?

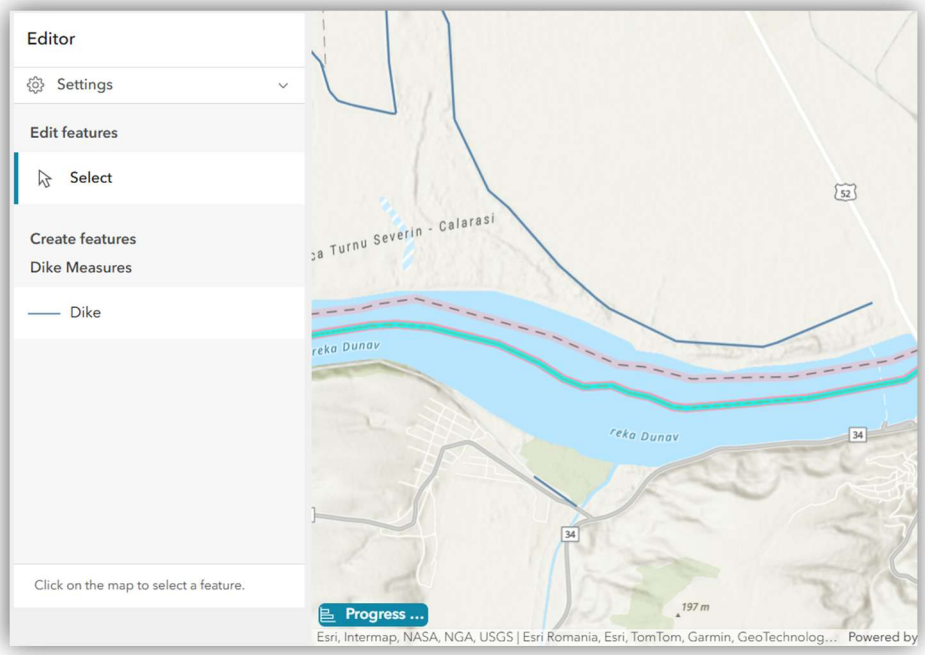

Then click continue. Suggested Measures are then displayed based on the problem analysis for that reach.

Select the proposed measures and click **Confirm Selection**. At the bottom of the screen the active problems assigned to this reach can be viewed.

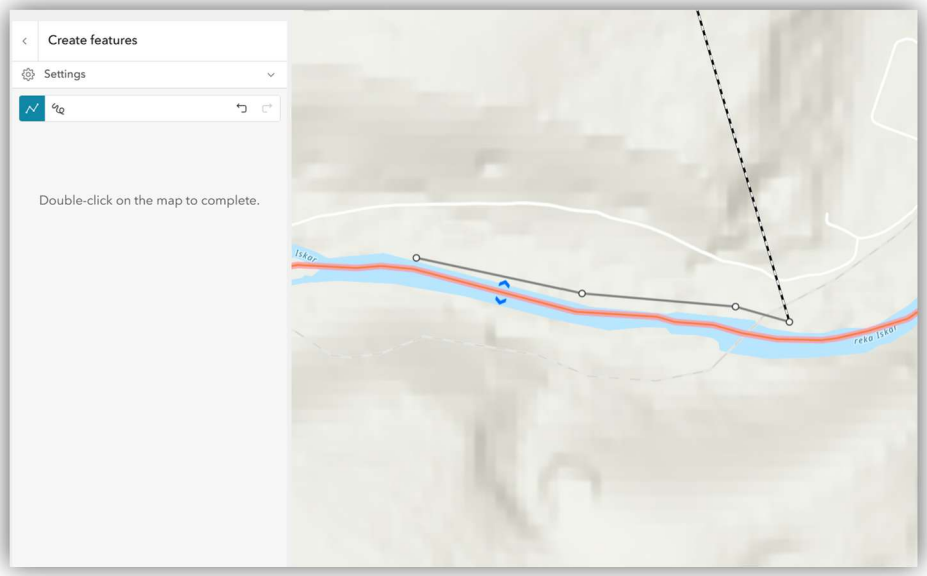

The selected measures are now displayed in their respective groups. Some measures, such as dike measures, require a **map assignment**, as indicated in the panel on the left. Click **Open Editor** to open the corresponding editor. The example on the right shows the **Dike Editor**.

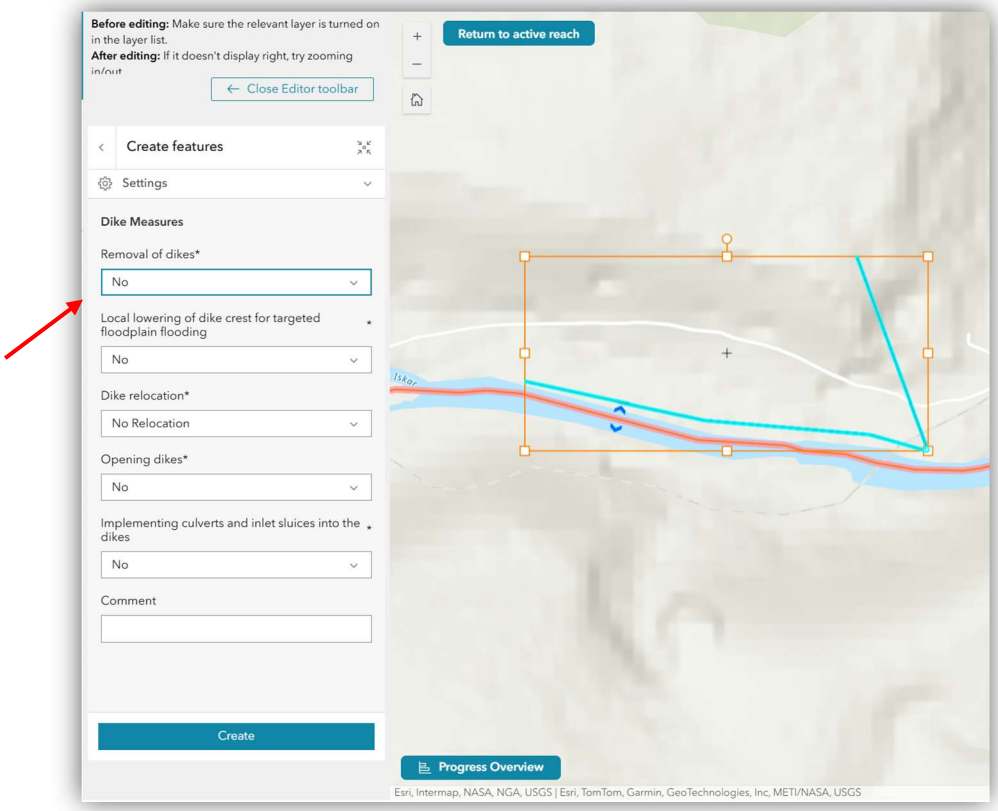

In the editor panel, click **Select** to edit an already existing Dike. Click on the respective feature in the map.

OR

In the editor panel, click **Dike** to draw a new dike. You can then choose to draw a dike either as a **straight line** or **freehand**. Once the dike has been drawn, click **Enter** to finish the drawing.

After selecting an existing dike or confirming the drawing, a form will automatically open asking for additional information about the dike.

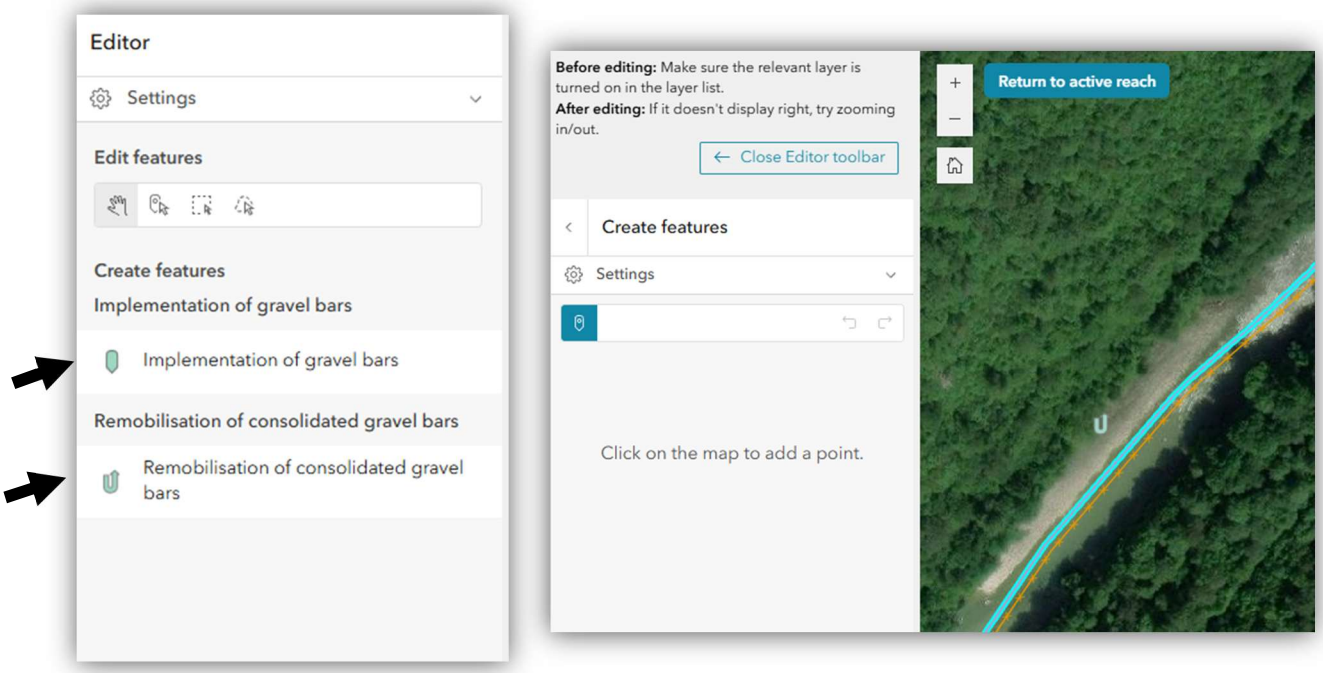

Here, specify what should happen to the feature. For example, indicate whether an existing dike should be e.g. removed, relocated or opened.

As a general rule, if a feature is missing from the map, please draw it first and then describe the intended action in the corresponding information field. If only part of a dike is affected, for example if a section should be removed or modified, draw only the relevant section and enter the appropriate information in the form.

Additional details can also be added in the **Comments** field where useful.

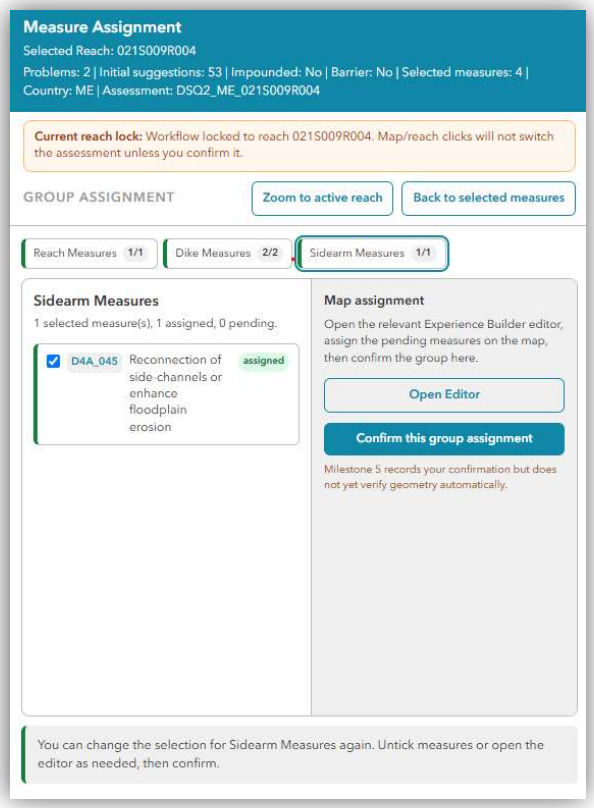

To exit the editor mode, click **Close Editor Toolbar**.

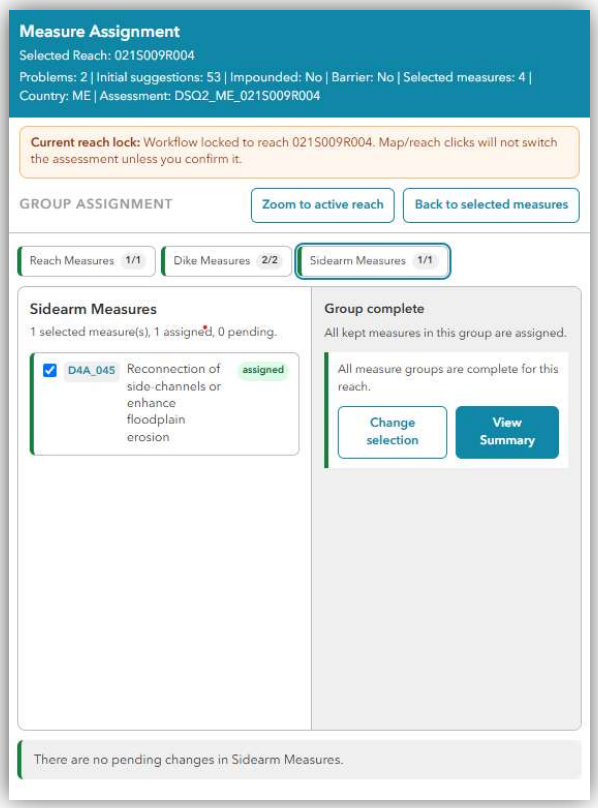

If the drawing mode is still active and the editor cannot be closed, first click the **<** button next to **Create Feature** (highlighted in red in the example). Then click **Close Editor Toolbar** again.

The same procedure applies to other features, such as **gravel bars**. In the editor panel on the left, select the relevant feature type. In the example shown, the available features are marked with arrows for illustration purposes.

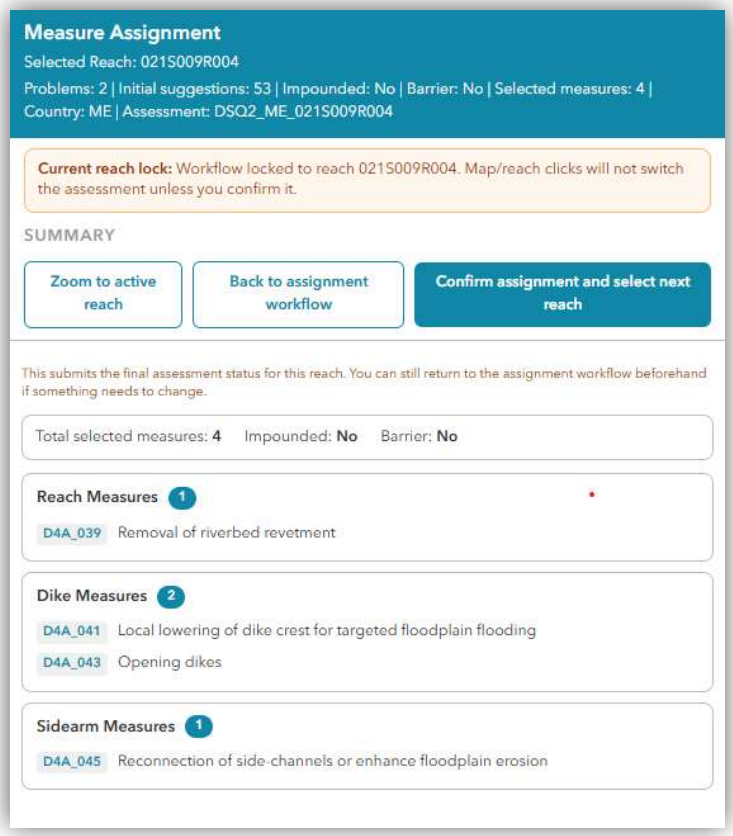

After selecting the feature, the corresponding drawing tool opens. The feature can then be drawn and completed following the same procedure described above.

After a group has been edited, using the editor where required, click **Confirm This Group Assignment**. The group status will then change from **Pending** (red) to **Assigned** (green).

Once all groups have been assigned, the status **Group Complete** will be displayed, as shown in the example on the right.

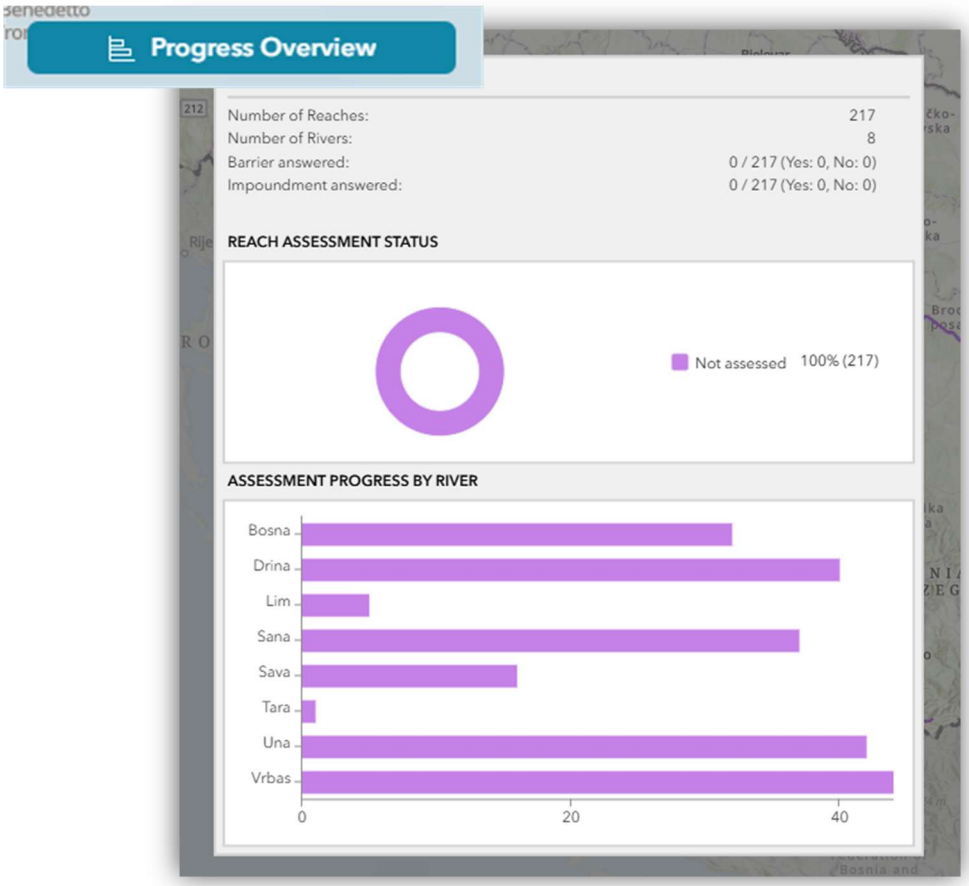

Once all groups are marked as **Assigned**, click **View Summary**. The summary provides an overview of all assignments and allows you to make any final changes if necessary.

When everything is correct, click **Confirm Assignment and Select Next Reach** to complete the current reach and continue with the next one.

Previously completed reaches can still be selected and edited later if changes are required.

Congratulations — you have successfully completed the assignment for a reach.

Click on Progress Overview on the bottom left of the page to view a summary of the assessment status.
