1. SELECTING A REACH

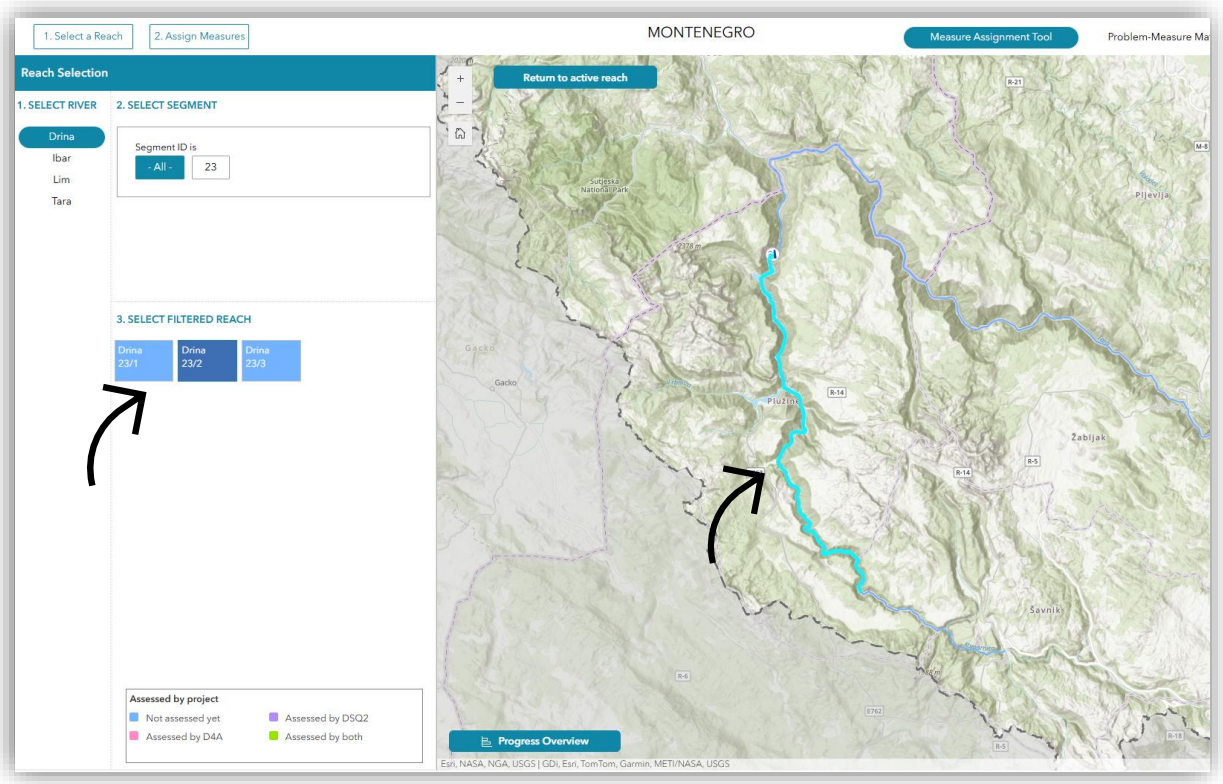

1.1 From the list

Select the river and the Segment ID. The list is filtered automatically. Click one of the displayed reach.

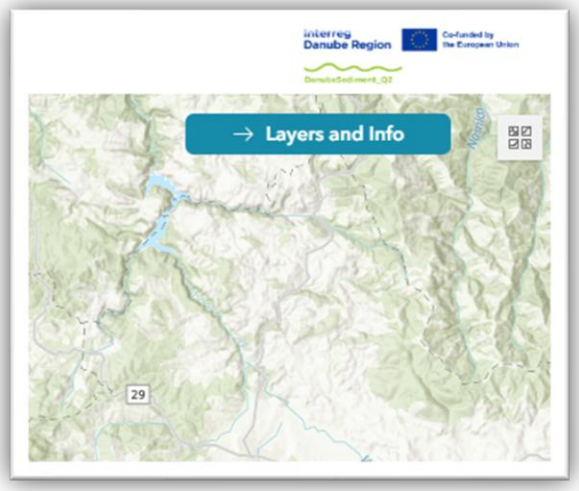

The colours of each tile show the assessment status of the reach by project. If the colour of a tile does not change after you have finished assessing the reach, try refreshing the page.

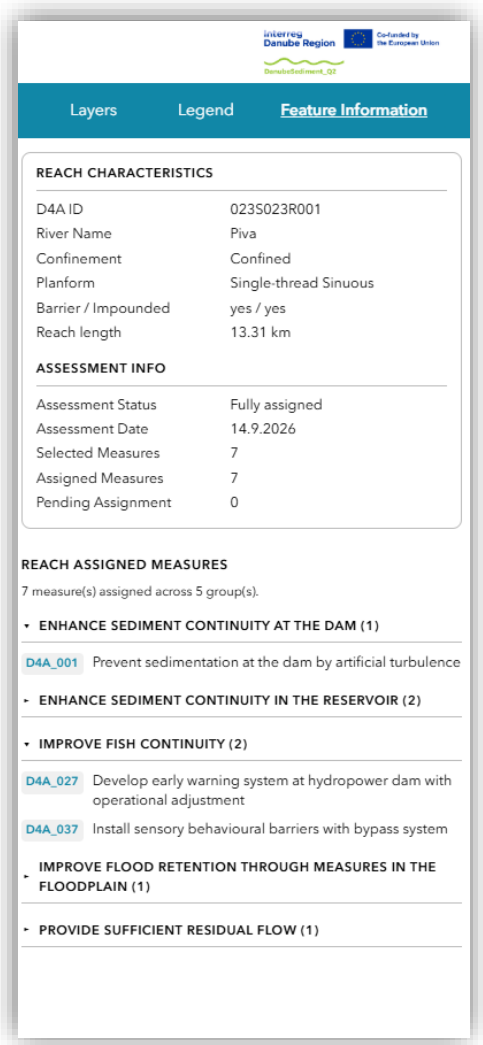

1.2 From the map

Click on a reach on the map. In the panel on the left, the selected reach will be highlighted. Click the highlighted reach in the selection panel and then proceed as usual.

Alternatively, you can use 2. **Assign measures** on the top right of the page after selecting a reach on the map.

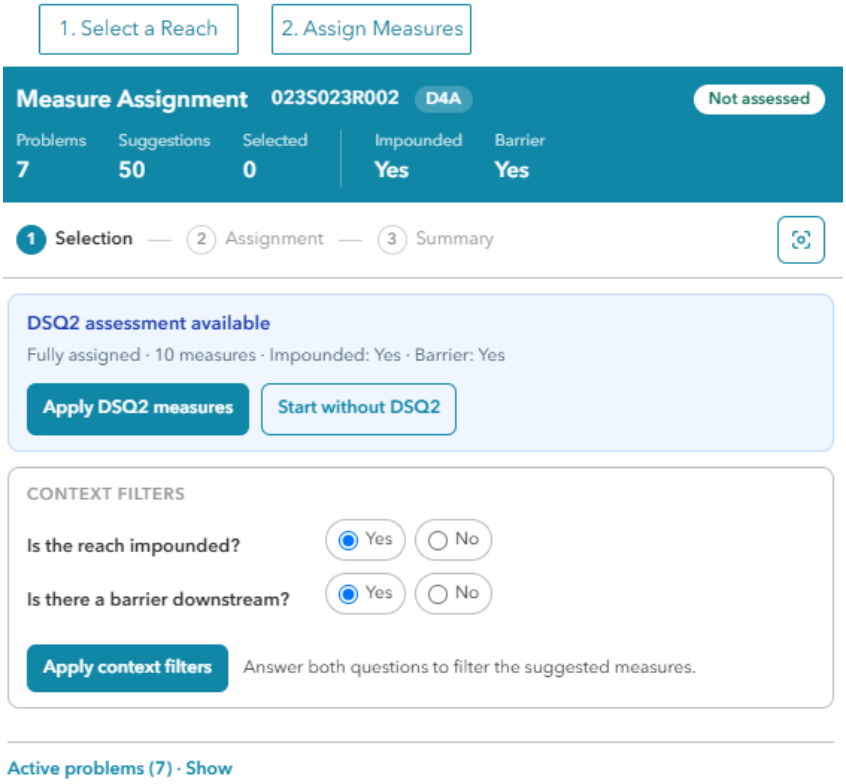

When a feature, such as a reach or barrier, is selected on the map, click on **Layers and Legend** in the side panel. There, you can view all available information related to the selected feature.

2. SELECTING MEASURES

2.1 Context questions

After selecting the reach, answer two yes/no questions:

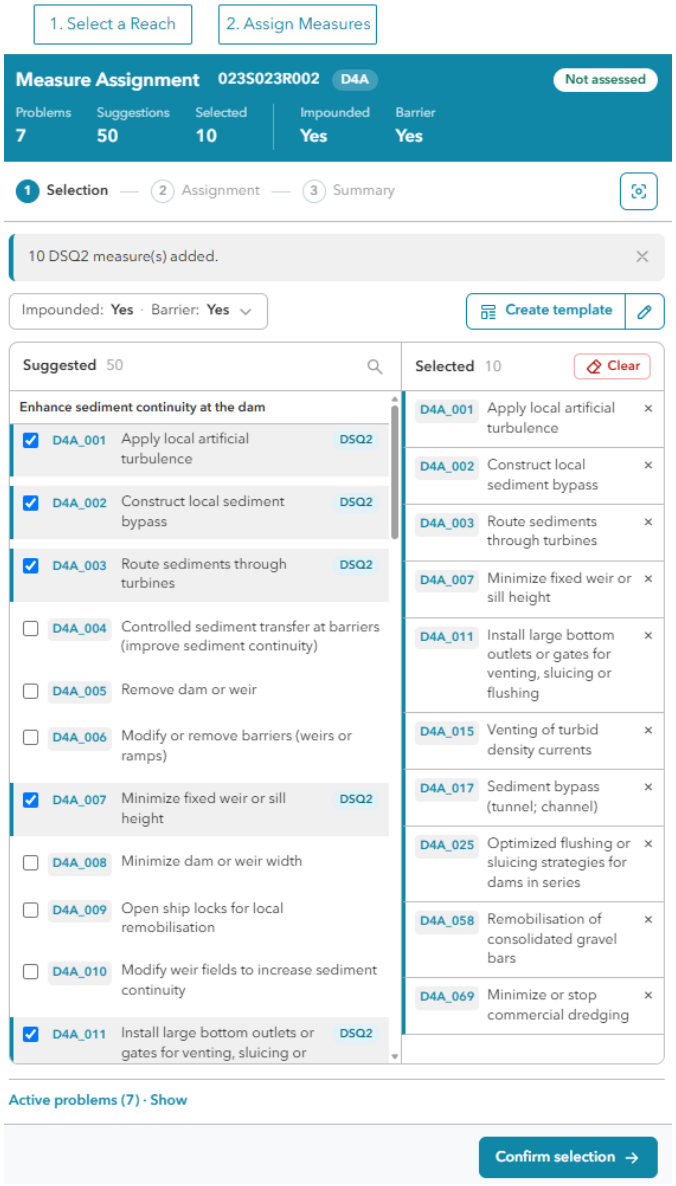

- Is the reach impounded?
- Is there a barrier downstream?

Your answer filter the measures you can choose from. For example, if there is no barrier downstream of a reach, no barrier measures will be suggested.

If the reach has already been assessed by the partner project, you can choose whether to apply the measures it has assigned. Please check that the context questions were answered correctly.

Then click **Apply context filter**. The suggested Measures, based on the problem analysis for the reach, are then displayed.

2.2 Selecting measures

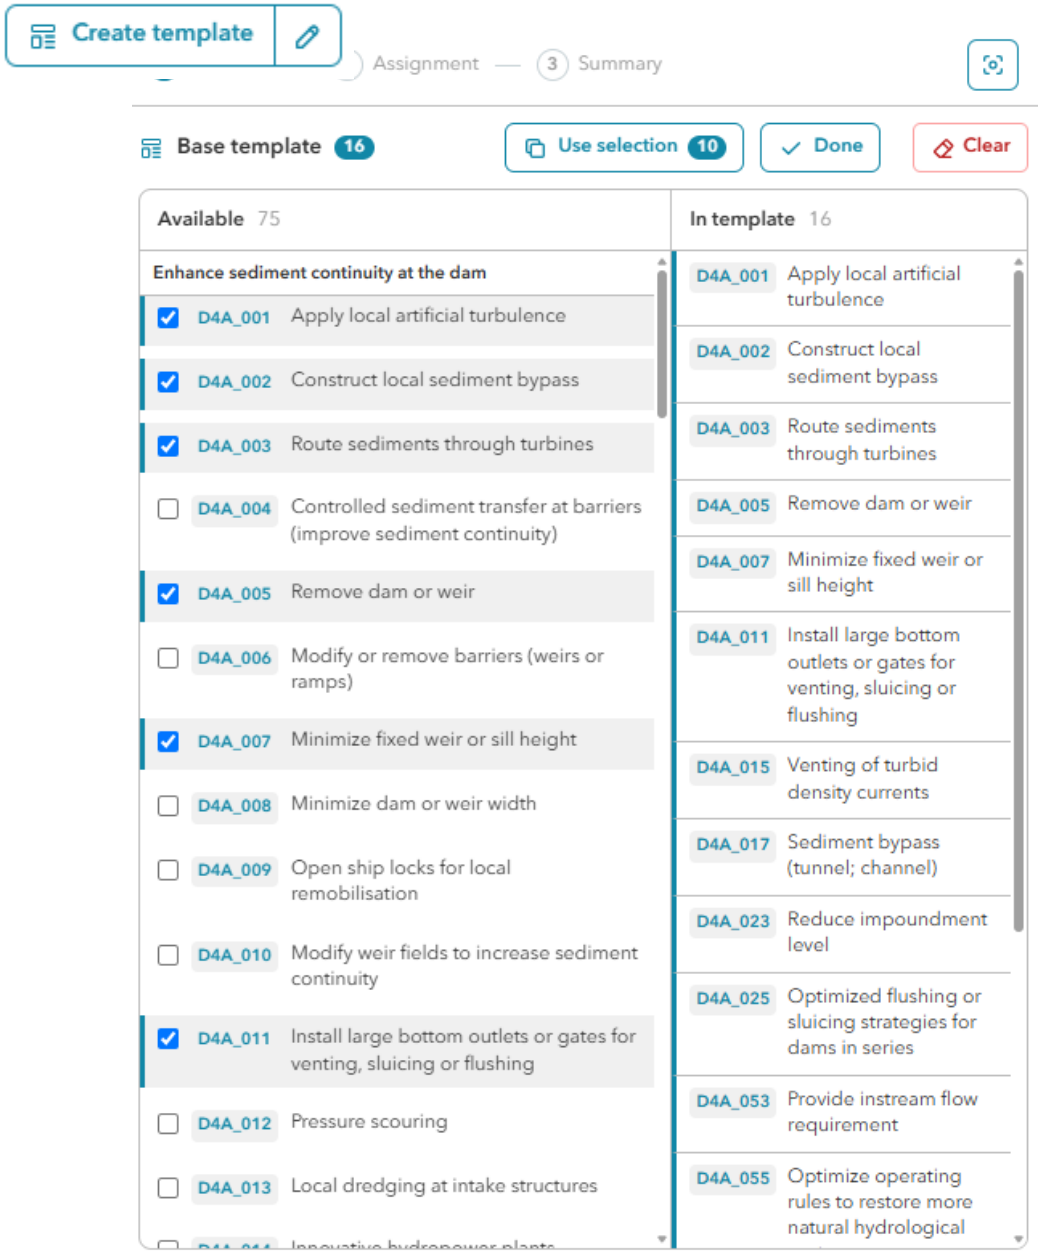

Select the measures you want to apply. You can untick a measure or click **×** in the **Selected** list to remove it again. When your selection is complete, click **Confirm selection**.

Note for D4A users: *Apply DSQ2 measures* is only a starting point. Remove any DSQ2 measures that don't fit the reach, and add the D4A measures that are relevant (e.g. for fish continuity).

Tip: Click **Show** next to **Active problems** to see the problems identified for this reach. Each relevant problem should be covered by at least one selected measure.

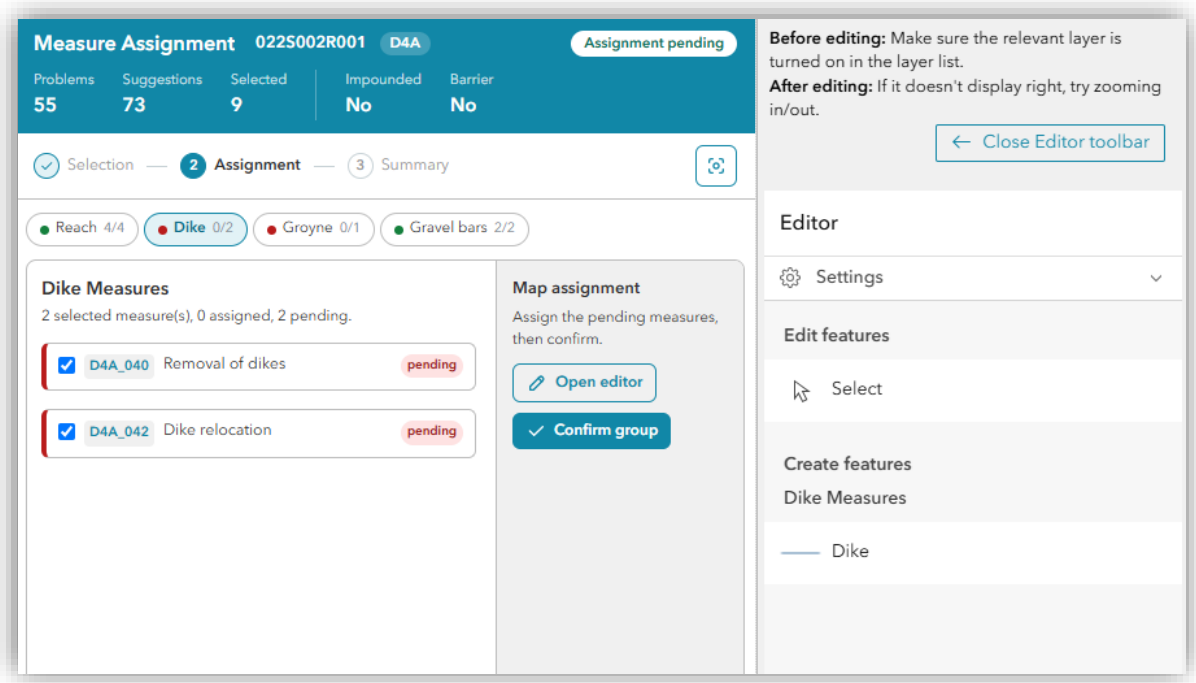

2.3 Templates

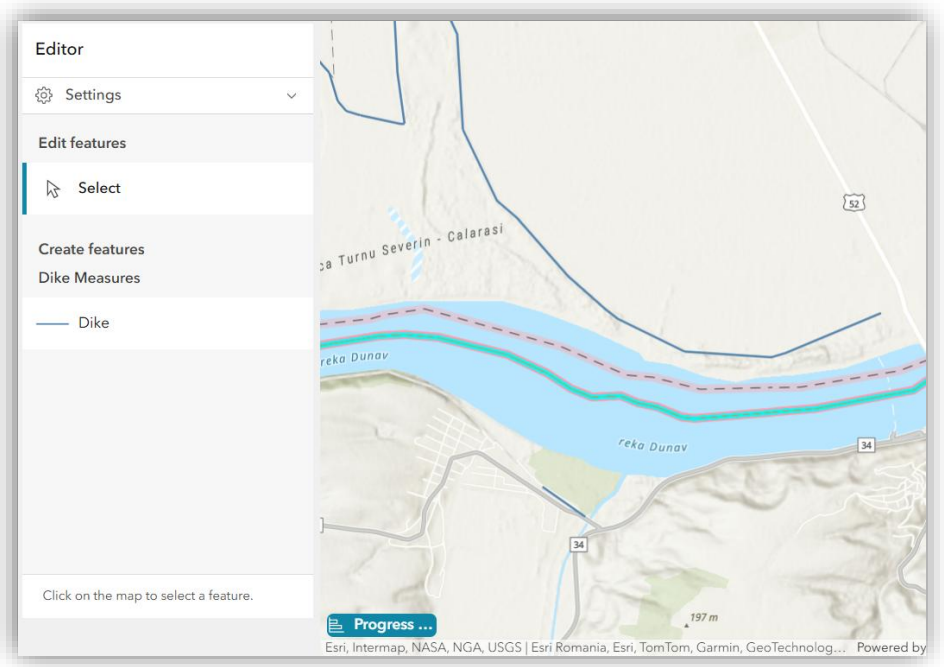

If you often assign the same set of measures, you can save it as a template. Select the measures and click **Create template**. For the next reach, apply the template instead of selecting each measure again. To edit or delete a template, click the pencil icon next to **Create template**.

Important: After applying a template, always check the selected measures and adjust them to fit the reach.

3. ASSIGNING MEASURES ON THE MAP

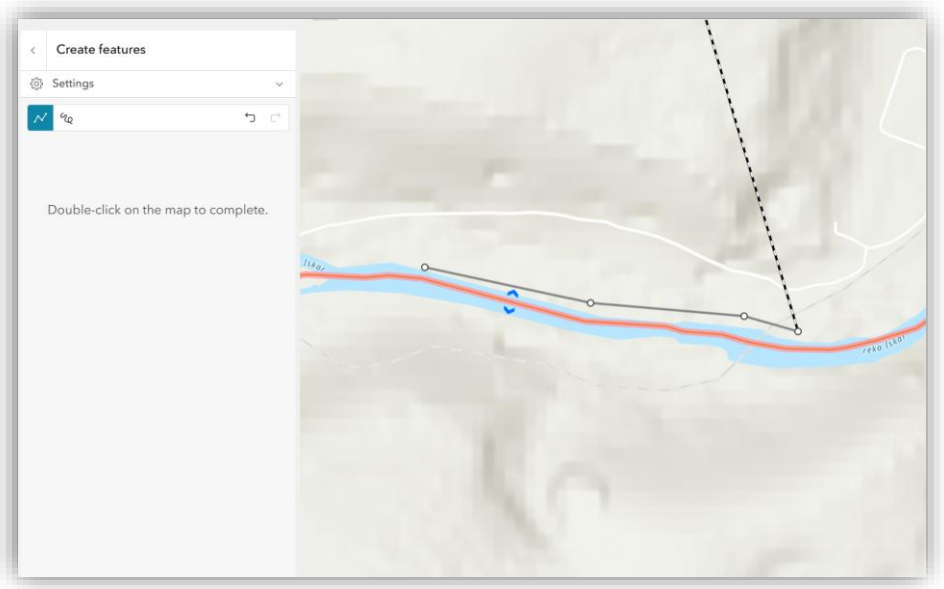

The selected measures are now displayed in their respective groups. Some measures, such as dike measures, require a **map assignment**, as indicated in the panel on the left. Click **Open Editor** to open the corresponding editor. The example on the right shows the **Dike Editor**.

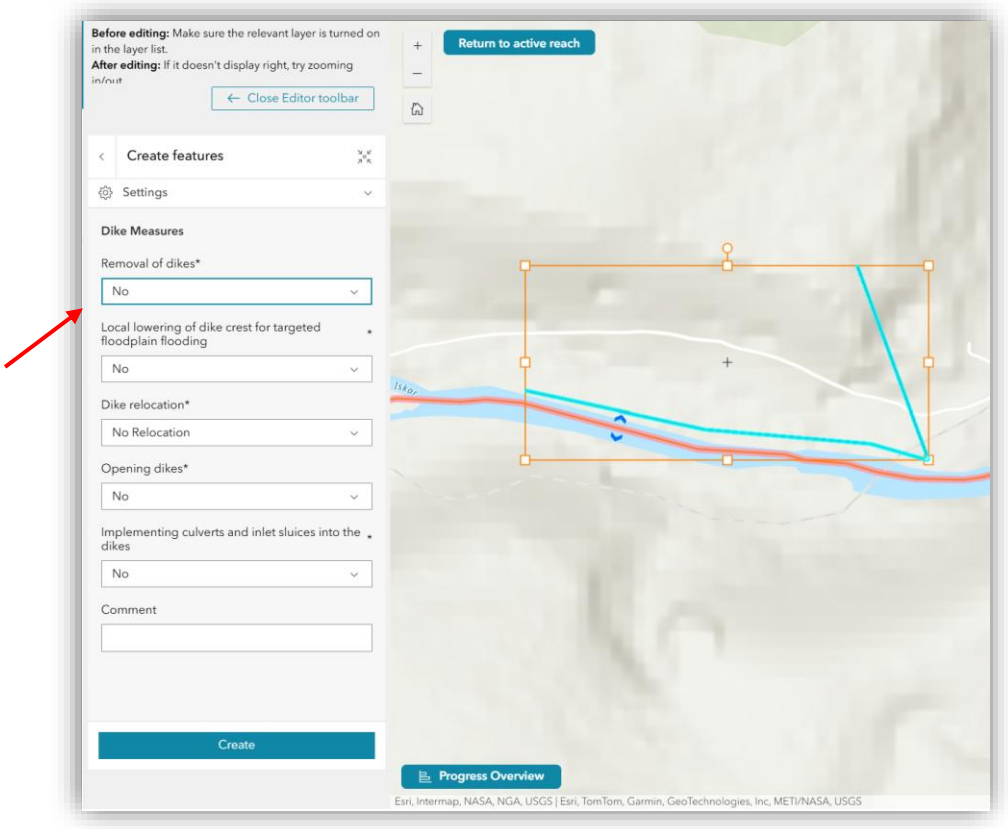

In the editor panel, click **Select** to edit an already existing Dike. Click on the respective feature in the map.

OR

In the editor panel, click **Dike** to draw a new dike. You can then choose to draw a dike either as a **straight line** or **freehand**. Once the dike has been drawn, click **Enter** to finish the drawing.

After you select an existing dike or finish a drawing, a form opens automatically, asking for additional information about the dike.

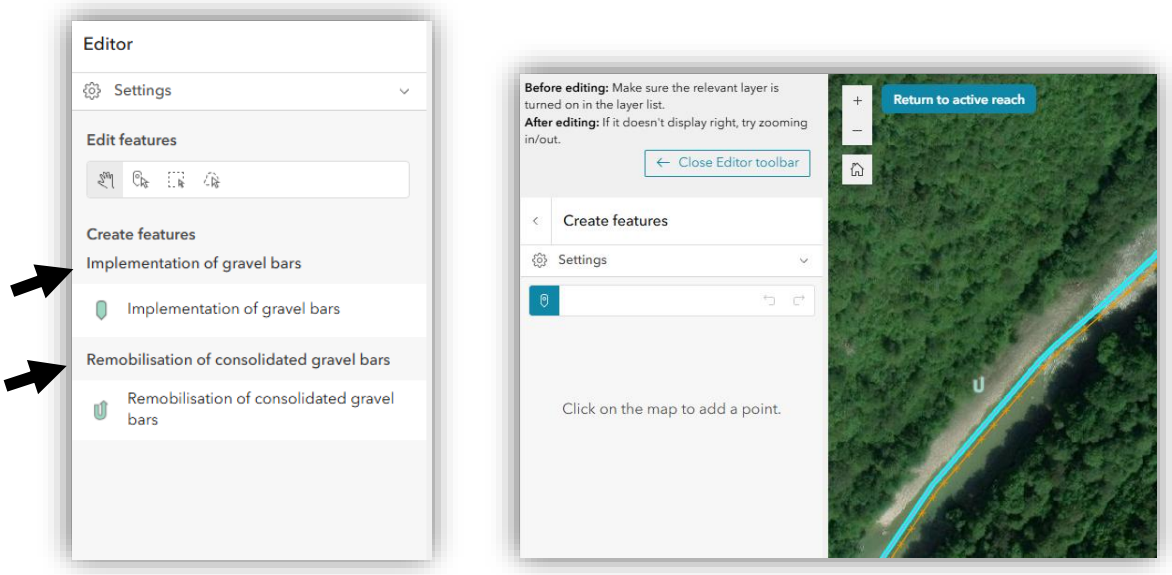

Here, specify what should happen to the feature, for example whether an existing dike should be removed, relocated or opened. **Only enter the measures you selected for this reach. These are listed in the panel on the left.** If you notice that another measure is needed, go back to the selection and add it there first.

As a general rule, if a feature is missing from the map, draw it first and then describe the intended action in the corresponding field. If only part of a dike is affected, for example if a section should be removed or modified, draw only that section and enter the relevant information in the form.

You can add more details in the **Comments** field.

To exit the editor mode, click **Close Editor Toolbar**.

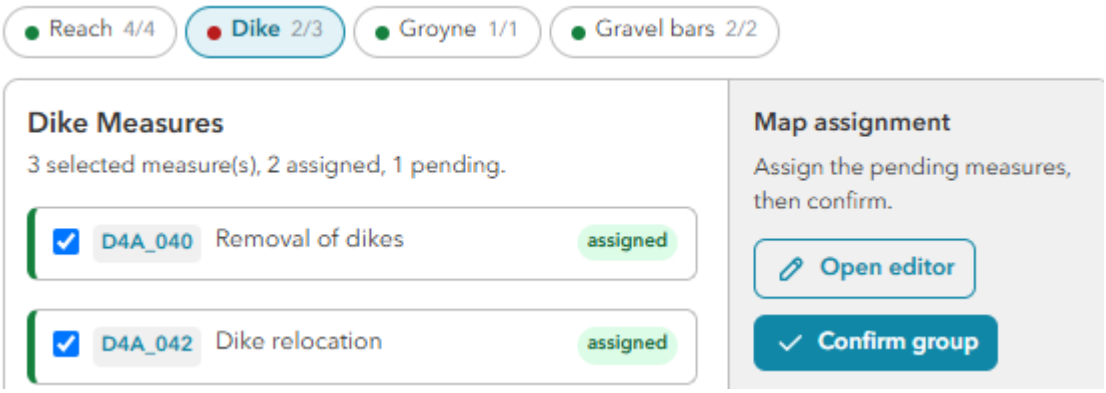

If the drawing mode is still active and the editor cannot be closed, first click the **<** button next to **Create Feature** (highlighted in red in the example). Then click **Close Editor Toolbar** again.

The same procedure applies to other features, such as **gravel bars**. In the editor panel on the left, select the relevant feature type. In the example shown, the available features are marked with arrows for illustration purposes.

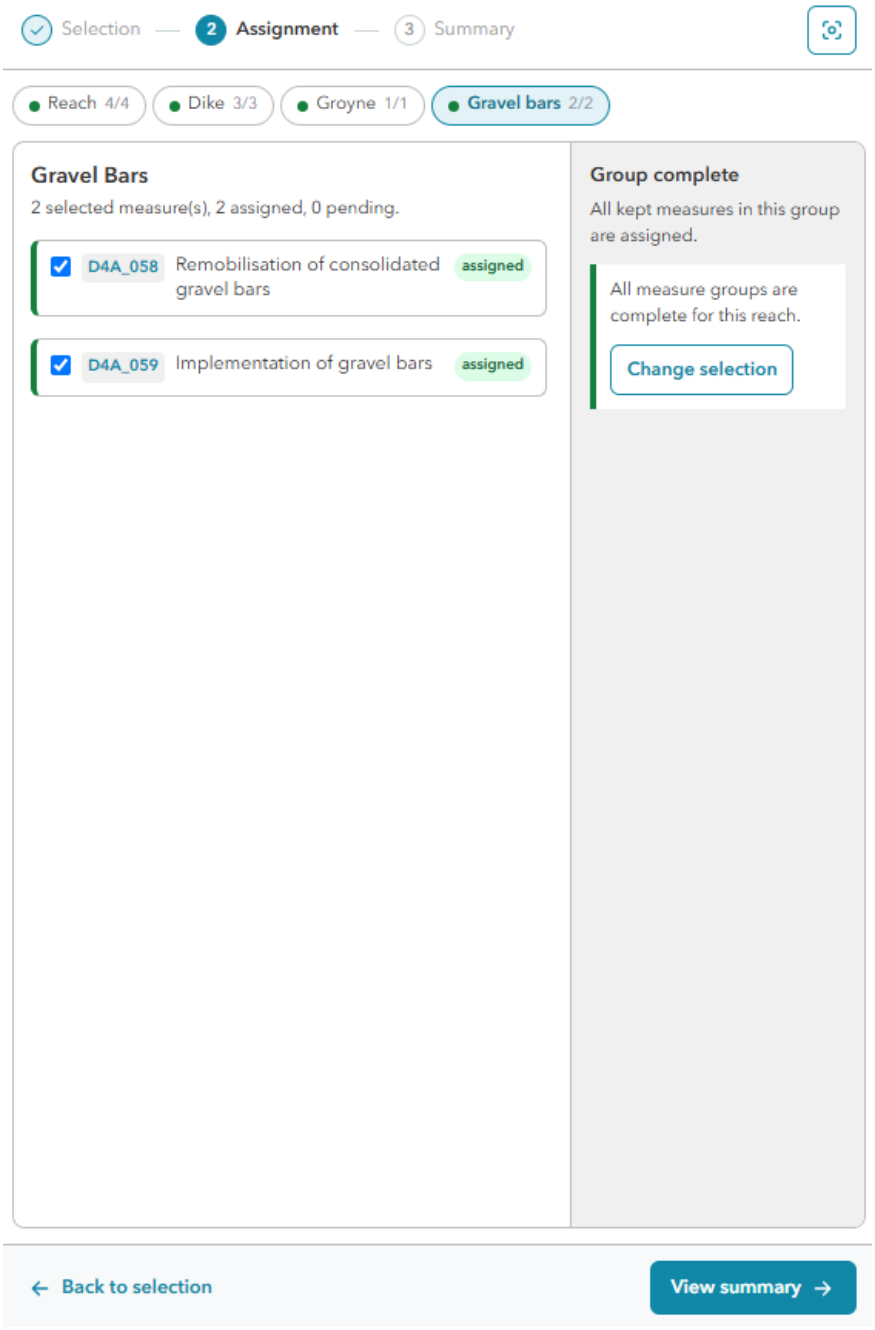

After selecting the feature, the corresponding drawing tool opens. The feature can then be drawn and completed following the same procedure described above.

After a group has been edited, using the editor where required, click **Confirm group.** The group status will then change from **Pending** (red) to **Assigned** (green).

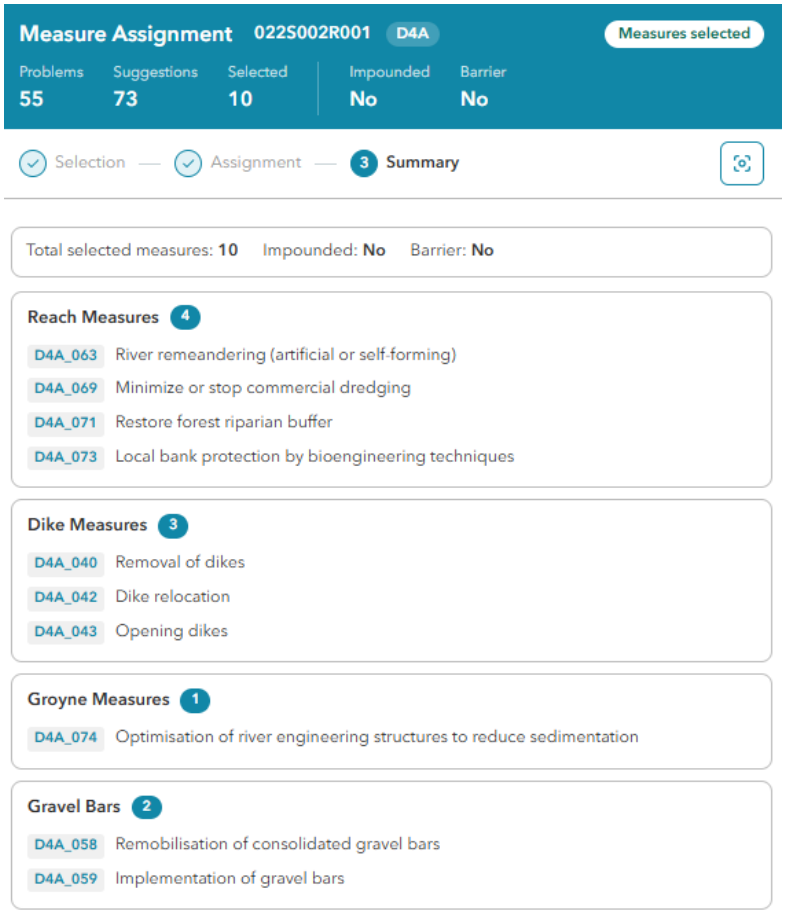

4. FINISHING A REACH

4.1 Summary and Finish reach

Once all groups have been assigned, the status **Group Complete** is displayed. You can now:

- click **View Summary** if you have finished assessing the reach,
- click **Change selection** to untick measures that have already been assigned, or
- click **Back to selection** to make other changes to the selected measures.

The summary provides an overview of all assignments and allows you to make any final changes if necessary.

When everything is correct, click **Finish reach and select next** to complete the current reach and continue with the next one.

Previously completed reaches can still be selected and edited later if changes are required.

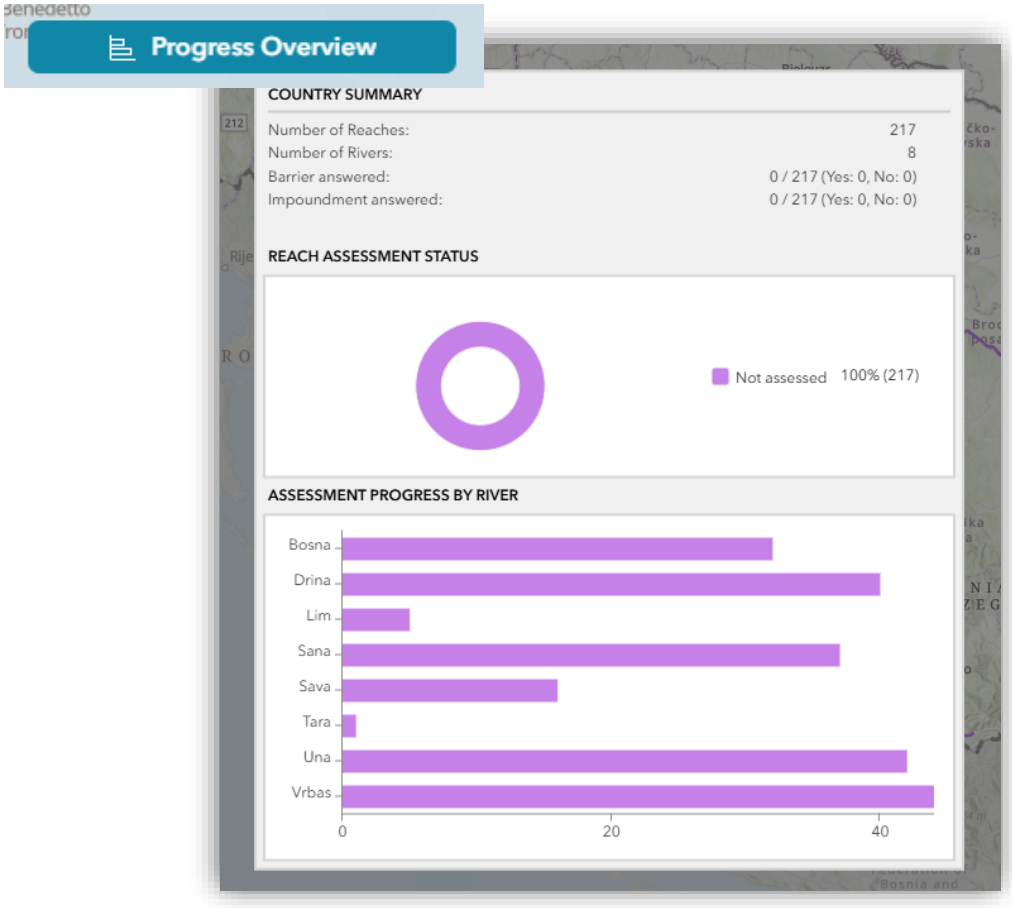

Congratulations — you have successfully completed the assignment for a reach!

4.2 Editing completed reaches

When you select a completed reach, the tool shows a read-only overview of its assigned measures, sorted by group. To make changes, click **Reopen assessment**. This takes you back into the workflow, where you can change the selection and map assignments as usual. When you have finished, complete the reach again.

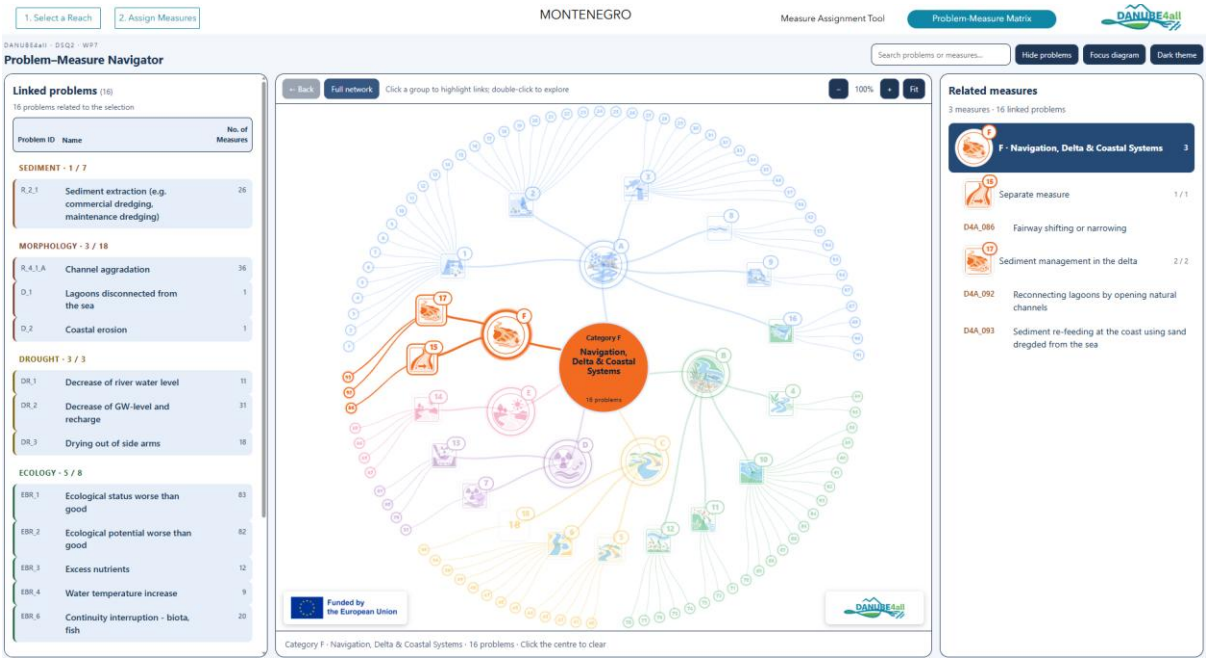

5. ADDITIONAL TOOLS

5.1 Progress Overview

Click on Progress Overview on the bottom left of the page to view a summary of the assessment status.

5.2 Problem-Measure Navigator

To open the Navigator, click the **Problem-Measure Matrix** button. It takes you to the Navigator page.

The Problem-Measure Navigator shows how problems and measures are linked. Use the switch at the top to show the links for your project (D4A or DSQ2). Click a measure or measure group (on the wheel or in the list on the right) to see the problems it addresses on the left. Or click a problem or problem group on the left to see the measures linked to it.

Use the Navigator when you're selecting measures for a reach. For example, if a reach has an active problem and you're not sure which measure fits, look up that problem to see all the measures that can address it. You can also click a measure to check why it was suggested.

Note: The Navigator only shows the general links between problems and measures. Whether a measure is realistic for a specific reach still depends on local conditions, so check the reach information and base data as well.
